# Introduction

3rd party providers

# Introduction

- **Autonomous and self-sufficient networks**
- **Training phase requires access to historical data**
- **Limit network traffic and augment data availability where it is used**

# Zones

- **Build zones according to the building structure**
  - Do the training where data is produced

# Zones - Splitting

$$C(Z_1, Z_2) = Ci(Z_1) + Ci(Z_2) + Ce(Z_1, Z_2)$$
$$Ci(Z) - \min(C(Z_1, Z_2)) > \epsilon_s$$

$C_i$ : Total number of hops between producers and storage peers

$C_e$ : Inter-zone costs depending on the filling rate of the child zone

# Zones - Merging

$$Cp(Z) = (Ci(Z_1) + Ci(Z_2)) * \ln(D(Z_1) + D(Z_2))$$
$$C(Z_1, Z_2) - Cp(Z) > \epsilon_m$$

$D$ : Depth of a zone's internal locations tree

# Entities - Storage Peers

- **Act as small databases for time-series**
- **Offer a RESTful interface hiding the internal storage technology (DBMS)**
  - Creating/deleting datasets
  - Inserting/reading data
- **Data insertion realized through multicast notifications of producers**

# Entities - Storage Coordinators

- Are managing a specific zone
- Decide whenever their zone should be split or merged
- Organize the repartition of data between storage peers
- Offer a RESTful interface for retrieving stored data on peers
  - Select the appropriate peers
  - Assemble the data

# Interfaces

- **General management interface (common multicast)**
  - Used for discovering zones
- **Zone interface (zone specific multicast)**
  - Inter-zone communications
  - Data storage announcement
  - Data retrieval
- **Server interface (unicast)**
  - Synchronization between master and slave storage coordinators

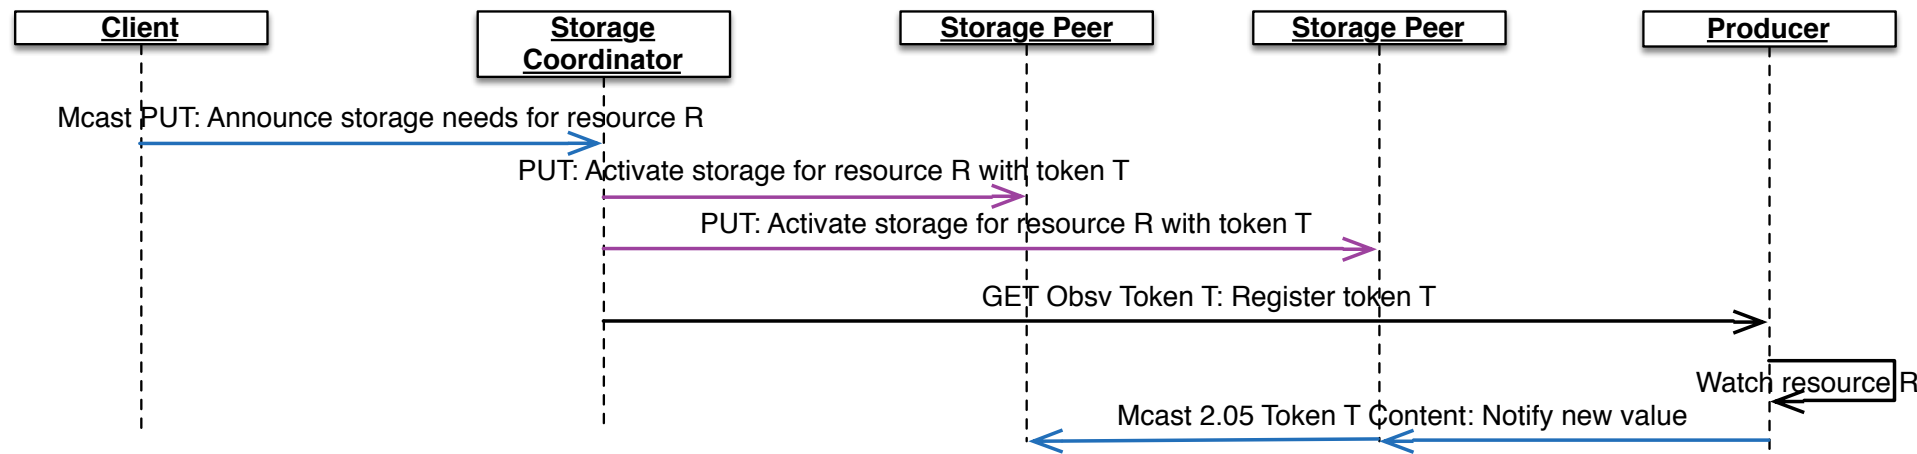

## Storing sensor data

- **Ensure replication on several databases**
  - Unicast is inefficient

# Storing sensor data

- CoAP observe and groupcomm are mutually exclusive
- Improvements of CoAP
  - Dynamically create multicast endpoints (token and multicast address)
  - Activate observation (multicast address)
  - Send notifications to multicast address
- No reliability possible

# CoAP multicast observation

- Combine observation and group communication

- Membership creation (from CoAP groupcomm)

```
POST /{+gp}  
{ "n": "All-  
Devices.floor1.west.bldg6.example.com",  
  "a": "[ff15::4200:f7fe:ed37:abcd]:4567",  
  "t": 1234 }
```

- Observation

- Use same token as for membership creation (t)
- Add option **Mcast-obsv** containing the multicast address (a)

# Usage - Zone discovery

# Usage - Data storage announcement

Mcast PUT /storage

```
{  
  "url": "temp.living.floor1.home.com/celsius",  
  "max-age": 90,  
  "unit": "day"  
}
```

# Usage - Data retrieval

Mcast GET home/floor1/kitchen/temp/celsius?  
from=2014-02-13&to=2014-02-18

```
[{"timestamp": "2014-02-13 13:54:01",
  "value": 21.7},
  ...
]
```

# Evaluation

## ■ 3 rooms over 2 floors as testbed

- 21 KNX and EnOcean sensors producing data
- 8 Flyport OpenPicus as storage peers
- 4 Raspberry Pies as storage coordinators

Each request returning **49** entries  
Average **186 ms** pro request

# Contributions

- **Location-based zone management**
  - Store data where it is needed
  - Efficient communications
  
- **Entirely anonymous communications with multicast**
  - Ensure availability
  - Insensitive to disturbances (storage coordinators)
  
- **CoAP adaptations for multicast notifications**
  - Becoming a draft?

# Conclusion

- **Extensible-cloud like storage**
  - Add devices for extending the capacity
  - Adapted for machine learning applications
- **Self adaptation according to required storage space**
- **Easy to use RESTful interfaces for retrieving time-series**
- **CoAP multicast notifications very useful**
  - Need for standardization

# Questions
